Co-founder and co-owner of FunRug Studio LLC. Open to relocation.

FunRug Studio | MAGE | Fish Party | Itch.io

Languages: C++, C#, Rust | **Engines:** Unity, Unreal | **Tools:** Git, Jira, Confluence

Education

Bachelor of Science in Game Programming — **Class of May 2028**

Champlain College — *Burlington, VT*

- Dean's List — *Fall/Spring 2025*
- President's List — *Spring 2026*
- GPA of 3.7/4.0
- Hearthlight Club Member, Rock Climbing Club Member

Project Experience

Lead Programmer — **Nov 2026 - Nov 2026**

Lighthouse Time Machine - Team Size: 5 - Itch.io — *Wolfjam 2026*

- Led programming in Unity for a real time strategy action game in under 24 hours. We placed second. For the theme of visibility, we utilized sprite masking to create sight management based gameplay.
- After 4 hours of prototyping a concept that kept failing, we completely pivoted to a separate, more intriguing, more well scoped game idea, allowing for a successful development process.
- Implemented a system to control ships with mouse dragging, and later added a slight movement boost on every use, improving the gamefeel, responsiveness, and player control, while not compromising the real time strategy aspect of the game.

Lead Programmer — **Jul 2026 - Current**

Fish Party - Team Size: 4 - Steam — *Indie Game Development*

- Developed a high-capacity local multiplayer system in Unity using C# supporting up to 12 simultaneous players and bots through a one-button control scheme, with 16+ independently behaving fish to play as.
- Built bot AI that evaluates the current game state, scores possible movement directions based on that data, and selects movement actions based on those scores; implemented difficulty scaling to accommodate new players.
- Created a movement system that allows for the 1 button control scheme, with the fish constantly rotating, button presses changing that direction. Later added that holding down the button triggers a dash, allowing for more skill expression, while keeping it simple and accessible.

Lead Programmer — **Jul 2026 - Jul 2026**

Little Cowboy - Team Size: 5 - Itch.io — *GMTK Game Jam 2026*

- Spearheaded C# programming in Unity for a revolver based deck-building roguelike, with a unique chamber of bullets every run. 48th most played game out of the 10,500 submitted games in the jam.
- Engineered the player and enemy systems, movement and health, the overall system for all elemental effects, the tool for tracking the player's unique bullets, and all of the AI for the 6 unique enemies.
- Created numerous interactions between various bullets, such as fire and oil, water and lightning, and more, to allow for the player to viably use many different playstyles.

Lead Programmer, Product Owner — **Sep 2024 - Jun 2026**

MAGE: Mega Awesome Gregarious Encounters - Team Size: 4 - Steam — *Indie Game Development*

- Championed programming using C# in Unity for a 2-4 player party fighting game with 21 characters, 200+ maps, unique character music, and numerous gameplay modifiers; shipped on Steam with 700+ sales and 5,000+ wishlists.
- Built a modular system for creating and modifying Mages utilizing scriptable objects, allowing designers to modify old characters and generate new characters without changing code.
- Developed a system to allow for persisting 'ghost' projectiles to allow for more lenient counter timing for all characters, while preserving the same game feel for all players.
